C_I is the I channel conversion loss factor, C_Q is the Q channel conversion loss factor, θ_R is the I-axis phase rotation in radians, B_I is the I channel DC offset in volts, B_Q is the Q channel DC offset in volts, and θ_E is the quadrature phase error in radians.

When the LO and RF frequencies are not equal, $\theta_{\rm R}$ can be set to 0 to simplify (5) and (6):

$$\hat{I}(t) = C_I I(t) + B_I \tag{7}$$

$$\hat{Q}(t) = C_Q(\cos\theta_E Q(t) - \sin\theta_E I(t)) + B_Q \quad (8)$$

 θ_R is only important in applications when the phase difference between the RF and LO signals must be known (i.e. phase detector).

Example: Apply a 16 GHz CW LO signal at +6 dBm and a 16.001 GHz CW RF signal at -2 dBm. To estimate the AD155180B's $\hat{I}(t)$ and $\hat{Q}(t)$ signals, start by determining all the parameters in (7) and (8).

 C_I and C_Q are determined by the conversion loss and amplitude imbalance of the AD155180B. From the datasheet's typical performance plots at 16 GHz, use 11.5 dB conversion loss and -0.5 dB amplitude imbalance to find C_I and C_O :

$$\frac{C_I + C_Q}{2} = 10^{(-11.5/20)} = 0.2661 \tag{9}$$

$$20\log(\frac{C_{\varrho}}{C_{I}}) = -0.5 \tag{10}$$

$$C_I = 0.2737$$
 $C_O = 0.2584$ (11), (12)

Quadrature phase error and DC offsets are also obtained from the typical performance plots at 16 GHz.

$$\theta_{\scriptscriptstyle E} = 2Deg. = -0.035 Radians \tag{13}$$

$$B_I = -0.002V$$
 $B_O = -0.003V$ (14), (15)

The next step in estimating $\hat{I}(t)$ and $\hat{Q}(t)$ is to calculate the ideal I(t) and Q(t) from the RF input signal. Given that the RF signal frequency is 1 kHz greater than the LO frequency, I(t) and Q(t) define an upper sideband tone of 1 kHz having a constant amplitude of:

$$\frac{A^2}{0.1} = 10^{(-2.0/10)} \tag{16}$$

$$A = 0.2512V (17)$$

From (3) and (17) we know:

$$I(t) = 0.1776\cos(2\pi 1000t) \tag{18}$$

and

$$Q(t) = 0.1776\sin(2\pi 1000t) \tag{19}$$

The final step in estimating $\hat{I}(t)$ and $\hat{Q}(t)$, the demodulator's real I and Q outputs signals, is to insert (11), (12), (13), (14), (15), (18), and (19) into (7) and (8) giving the final result:

$$\hat{I}(t) = 0.049\cos(2\pi 1000t) - 0.002$$

$$\hat{Q}(t) = 0.046\sin(2\pi 1000t - 0.035) - 0.003$$
